SUMMARY

Graduate student pursuing MS in Computer Science (December 2026) seeking internships in artificial intelligence, machine learning, computer vision, or software engineering, with experience in deep learning, full-stack development, and cloud deployment.

EDUCATION

University of Alabama at Birmingham

Birmingham, AL

MS, Computer Science

Expected, December 2026

Relevant Coursework: Advanced Data Structures & Applications, Machine Learning, NLP (Natural Language Processing), GPU Programming, Deep Learning, Foundations of Data Science

BA, Computer Science

December, 2024

BS, Kinesiology with a concentration in exercise science

May, 2023

WORK EXPERIENCE

Nail Salon Receptionist | Manager

January 2019 - Present

- Manage daily operations and lead team of 15+ employees, including hiring, training, and performance tracking
- Drive digital marketing initiatives across Instagram, Facebook, and Google Ads to increase client acquisition
- Resolve customer conflicts and deliver exceptional service, resulting in hundreds of 5-star reviews

TECHNICAL SKILLS

Programming Languages: Python, JavaScript/TypeScript, Java, C/C++, SQL, HTML/CSS

Machine Learning & AI: PyTorch, Scikit-learn, OpenCV, Computer Vision

Data Science: Pandas, NumPy, Matplotlib, Seaborn, Jupyter Notebooks, Google Colab

Web Development: Node.js, Express.js, Angular, React, Bootstrap, Flask, FastAPI, RESTful APIs

Databases: MongoDB, PostgreSQL, MySQL, MongoDB Atlas

Cloud & DevOps: AWS (EC2, Route 53, Application Load Balancer, Certificate Manager), OAuth 2.0, PM2, Git, GitHub

TECHNICAL PROJECTS

Song2Color - Music Genre & Tag Color Visualization

March 2026 – April 2026

- Trained Word2Vec skip-gram models on Spotify co-occurrence data to learn 32-dim genre and 64-dim tag embeddings, validated with KNN neighbor coherence and UMAP clustering
- Designed a VAE on 96-dim concatenated song vectors to learn a structured 16-dim latent space, enabling smooth interpolation between any two songs and generation of novel color visualizations for unseen genre-tag combinations
- Mapped embeddings to color via PCA-to-HSV projection using principal component angles as hue, ensuring dissimilar genres produce maximally contrasting colors across the full spectrum
- Diagnosed and resolved posterior collapse through KL floor regularization and β -annealing; separated genre and tag training pipelines to eliminate tag noise interference on genre cluster quality

F1 Lap Time Prediction - LSTM Regression Model

March 2026 – April 2026

- Built an end-to-end LSTM pipeline using FastF1 API to collect and process multi-season telemetry data, engineering fixed-length time-series inputs via distance-based resampling of speed, throttle, brake, RPM, gear, and DRS
- Designed an LSTM model integrating track embeddings and weather features for multi-modal prediction
- Implemented full ML pipeline including normalization, train/validation/test splits, caching, and model checkpointing

Alarmify - Spotify Alarm Clock Web Application

December 2025 – February 2026

- Architected a full-stack web application integrating Spotify Web API with OAuth 2.0 authentication to let users create alarms that play their selected playlists at scheduled times
- Developed a Node.js/Express REST API with JWT authentication, MongoDB with Mongoose ODM, and a cron-based scheduler that triggers Spotify playback automatically
- Deployed on AWS EC2 with Application Load Balancer, Route 53, and Certificate Manager for SSL/TLS
